

A Guide to Star Names, Pronunciations, and Related Constellations

Proper Star Names: There are over 300 proper star names that are used and accepted worldwide today -- and approved by the International Astronomical Union. Most of them come from the ancient Arabic cultures, but there are many star names in common use from the Greek, the Roman, European, and other cultures as well.

On the pages below you will find an alphabetical list of many, but not all, of the proper star names, their pronunciations, and related constellations.

Star Catalogs that are Currently Used by Astronomers

1. Bayer Catalog: This first widely recognized star catalog was published by German astronomer Johann Bayer in 1603. This list of naked-eye stars indexes the stars in each constellation, using the letters of the Greek alphabet, followed by the genitive form of its parent constellation's Latin name, e.g., alpha Orionis. Typically, the brightest star in each constellation received the first Greek letter (alpha), the second brightest star the second letter (beta), and on-and-on. But you will often notice that the Bayer sequencing of the bright stars in the constellations is not true to what we see and know today about their apparent brightness. Original errors in the brightness estimates, along with the brightness variability of the stars (like Betelgeuse in Orion), have caused the Bayer sequencing not to match the stellar brightness that we observe today. There are over 1,500 stars in the Bayer catalog.

2. Flamsteed Catalog: English Astronomer John Flamsteed published this catalog of over 2,500 naked-eye stars around 1725. Instead of using Greek letters, he numbered the stars in each constellation, followed by either the genitive form of its parent constellation's Latin name or the 3-letter abbreviation of the constellation's name, e.g., 51 Pegasi or 51 Peg. The numbers were originally assigned in order of their increasing "[right ascension](#)" position within each constellation, i.e., west to east, but, due to the effects of precession, they are now slightly out of order in some places.

Flamsteed observed Uranus in 1690 (some 91 year before William Herschel discovered the planet in 1781), but he did not recognize it as a planet and entered it into his catalog as a star called "34 Tauri"!

3. Modern Catalogs: There are many modern catalogs that index the stars, and their listings contain tens of thousands to millions of stars. Here are some of them:

Star Catalog Name	Abbreviation
Harvard Revised	HR
Henry Draper	HD
U.S. Naval Observatory	USNO
Guide Star	GSC
Hipparcos	HIP
Tycho	TYC
Smithsonian Astrophysical Observatory	SAO

Example: Deneb – the brightest star in the constellation Cygnus:
 Alpha Cygni; 50 Cyg; HR 7924;
 HD 197345; SAO 49941;
 HIP 102098; TYC 3574-3347-1
